

## **Atropurpureum Black-Leaved Clover**

*Trifolium repens 'Atropurpureum'*

Plant Height: 3 inches

Flower Height: 4 inches

Spread: 18 inches

Sunlight:

Hardiness Zone: 4a

### **Description:**

A showy form of clover with attractive dark purple leaves that are edged in bright green; the roots of this plant fix nitrogen in the soil; potentially invasive, rooting at the nodes; use where it can roam freely as groundcover, with shrubs or bulbs

### **Ornamental Features**

Atropurpureum Black-Leaved Clover features dainty clusters of lightly-scented white pea-like flowers at the ends of the stems from mid spring to early summer. Its attractive small round compound leaves remain deep purple in color with distinctive green edges throughout the season.

### **Landscape Attributes**

Atropurpureum Black-Leaved Clover is a dense herbaceous perennial with a ground-hugging habit of growth. Its medium texture blends into the garden, but can always be balanced by a couple of finer or coarser plants for an effective composition.

This is a high maintenance plant that will require regular care and upkeep, and is best cleaned up in early spring before it resumes active growth for the season. It is a good choice for attracting bees and butterflies to your yard. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Spreading
- Invasive

Atropurpureum Black-Leaved Clover is recommended for the following landscape applications;

- Mass Planting
- Rock/Alpine Gardens
- General Garden Use
- Groundcover
- Naturalizing And Woodland Gardens

### **Planting & Growing**

Atropurpureum Black-Leaved Clover will grow to be only 3 inches tall at maturity extending to 4 inches tall with the flowers, with a spread of 18 inches. Its foliage tends to remain low and dense right to the ground. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 10 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant does best in full sun to partial shade. It does best in average to evenly moist conditions, but will not tolerate standing water. This plant is capable of fixing its own nitrogen, which means that it is effectively self-fertilizing. As a result it should not require supplemental fertilizing, and if you do fertilize it, be sure to only use a low-nitrogen fertilizer to promote root growth. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This is a selected variety of a species not originally from North America. It can be propagated by division; however, as a cultivated variety, be aware that it may be subject to certain restrictions or prohibitions on propagation.
